

I followed the steps you provided to get ESLint installed. I used stack overflow and eslint.org to get the rules configured.

I had an issue with the rule that I used being outdated and I had to search through stack overflow posts to find a solution.

I can see how ESLint can be very useful in maintaining the format of my files and catching small mistakes that might not stop the code from running but might cause issues down the road, especially if there are multiple people working on the project.
